RI CYCDIASMIC CHINGET OF THE ALPHA 1 SUDDUILT. F.

RI NACUTE 368:67-70(1994).

RI CYCDIASMIC LINKET OF THE ALCIUM CHANNELS (VSCC) MEDIATE THE CC. IN CYTAGE-SENSITIVE CALCIUM CHANNELS (VSCC) MEDIATE THE CC. IN A VARIETY OF CALCIUM INTO EXCLIDANCE CELLS AND ARE ALSO INVOLVED CC. IN A VARIETY OF CALCIUM CERVENTENT PROCESSES, INCLUDING MUSCLE CONTRACTION, HORMONE OR NEUROTRANSMITTER RELEASE, GENE EXPRESSION, CC. CHANNELS BELONG TO PAND/OR Q-TYPE CALCIUM CURRENTS. P/Q-TYPE CALCIUM CC. CHANNELS BELONG THE FIGH-VOLTAGE ACTIVATED" (HVA), GROUP AND CC. IVA (OMEGA-ACA-IVA). THEY ARE HOWEVER INSENSITIVE TO DIHYDROPYRIDINES (DHP), AND OMEGA-CONOTOXIN-GVIA (OMEGA-ACA-IVA). THEY ARE HOWEVER INSENSITIVE TO COMPLEXES, CONSISTING OF ALPHA-1, SUBJUNIT. IN MANY CASES, THIS CONCELLENT TO GENERATE VOLTAGE-SENSITIVE CALCIUM CHANNELS ARE MULTISUBUNIT COMPLEXES, CONSISTING OF ALPHA-1, SUBJUNITS. IN MANY CASES, THIS CHANNEL ACTIVITY. THE AUXILIARY SUBJUNITS BETA AND DELTA SUBJUNITS. CC. IN A 1:1:1:1 RATIO. THE CHANNEL ACTIVITY IS DIRECTED BY THE PORE-FORMING AND VOLTAGE-SENSITIVE ALPHA-1 SUBJUNITS. IN MANY CASES, THIS CC. IN A 1:1:1:1 RATIO. THE AUXILIARY SUBJUNITS BETA AND ALPHA-2/DELTA CLANNEL ACTIVITY. THE AUXILIARY SUBJUNITS BETA AND ALPHA-2/DELTA CC. INSURED BY A DISULFIDE BRIDGE REGULATE THE CHANNEL ACTIVITY.

CC. IN A 1:1:1:1 RATIO. THE GANIN HERED, ASPONDUCED BY ALTERNATIVE CC. IN THE BRAIN, A SHORT ISOFORM BI-1/1A-1 AND ALDELTA SUBJUNITS. BETA AND ALPHA-2/DELTA CC. INTEGRAL MEXERANCE PACTOLIUM.

CC. INTURBATION OF THE FORM HERED, ARE PRODUCED BY ALTERNATIVE CC. THE Q-TYPE BEING A PROMINENT CALCIUM CC. INTEGRAL MEXERANCE PACTOLIUM.

CC. INTURBATION OF THE FORM INTERNAL REPEATS CONTAINS SIVE CONTAIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (2)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Specific commitment of different pre-mRNAs
                                                                                                                                                                                                                                FUNCTION: NECESSARY FOR THE SPLICING OF PRE-MRNA. IT IS REQUIRED FOR FORMATION OF THE EARLIEST ATP-DEPENDENT SPLICING COMPLEX AND INTERACTS WITH SPLICEOSOMAL COMPONENTS BOUND TO BOTH THE 5' AND 3' SPLICE SITES DURING SPLICEOSOME ASSEMBLY. IT ALSO IS REQUIRED FOR ATP-DEPENDENT INTERACTIONS OF BOTH U1 AND U2 SNRNPS WITH PRE-MRNA. INTERACTS WITH OTHER SPLICEOSOMAL COMPONENTS, VIA THE RS DOMAINS, TO FORM A BRIDGE BETWEEN THE 5' AND 3' SPLICE SITE BINDING COMPONENTS, U1 SNRNP AND U2AF. IN VITRO, BINDS SF2/ASF, U1-70K AND THE 35 KD BUT NOT THE 65 KD SUBUNIT OF U2AF. BINDS TO PURINE-RICH RNA SEQUENCES, EITHER 5'-AGSAGAGTA-3' CAN BIND TO BETA-GLOBIN MRNA AND COMMIT IT TO THE 5' COTTCGAGTA-3'. CAN BIND TO BETA-GLOBIN MRNA AND COMMIT IT TO THE SPLICENCE PATHWAY.
SUBCELLULAR LOCATION: NUCLEAR.
ALTERNATIVE PRODUCTS: DIFFERENT FORMS OF THE PROTEIN MAY BE PRODUCED BY ALTERNATIVE SPLICING.

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

If all 1: Styl : English.

NA encoding the water-soluble polypeptide with a high affinity for IFN-alpha and -beta is isolated by PCR, using appropriate coligonucleotides as primers and cloned CDNA as template. For example, bacteriophage lambda ZAP, containing the entire coding sequence of the IFN-alpha and -beta receptor (Q30533), was incubated with oligos C 030534 and 030535 R28496 represents the complete receptor. R28495 lacks the transmembrane and cytoplasmic domains. Both forms bind IFN in the same way as antibodies so are immunosuppressants e.g. for toxic side-effects of known immunosuppressants such as steroids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

                                                                                                                                                                                       New human alpha-interferon receptor protein - useful for testing interferon agonists and in treatment or diagnosis Disclosure; fig 4; 30pp; French.

This recombinant human alpha interferon (IFN) receptor protein is useful for the testing of IFN agonists and for treatment and diagnosis of viral diseases and tumours. Antibodies raised against this protein can be used for blocking the receptor when required, eg where overexpression of alpha-IFN is harmful. The Abs are also useful for eg drug targetting. Variants of the protein, having residues 164 (Thr) replaced by Arg and an Asp inserted between residues 479 and 480, are also useful.

The invention covers derivatives of the interferon-alpha and/or beta receptor obtained by deleting the transmembrane and cytoplasmic domains of the native receptor or by substitution. Potentially immunogenic epitopes are eliminated and the deriv. can be secreted from transformed cells. Soluble deriv.s block the activity of IFN alpha/beta and can be used to treat autoimmune diseases or to inhibit graft rejection. See also 014239.
31-MAR-1993 (first entry)
Sequence of a soulble form of the interferon (IFN) receptor with a high affinity for IFN-alpha and -beta.
Interferon receptor; alpha-interferon; beta-interferon.

Claim 3; Fig 2; 58pp; English.
DNA encoding the water-soluble polypeptide with a high affinity for IFN-alpha and -beta is isolated by PCR, using appropriate oligonuclectides as primers and cloned cDNA as template. For example, bacteriophage lambda ZAP, containing the entire coding sequence of the IFN-alpha and -beta receptor (Q30533), was incubated with oligos 230534 and Q30535. R28496 represents the complete receptor. R28495 lacks the transmembrane and cytoplasmic domains. Both forms bind IFN in the same way as antibodies so are immunosuppressants e.g. for treating autoimmune diseases and graft rejection. They lack the toxic side-effects of known immunosuppressants such as steroids. Sequence 557 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Water soluble polypeptide(s) strongly bind interferon(s) alpha and beta - useful as immunosuppressants, for treating auto:immune

                                                                                                                                                Compsn. of monoclonal antibodies against interferon receptor useful as immuno:modulator, eg. for treating AIDS Disclosure; Fig.3A-2B; 105pp; English.

The amino acid sequence of human interferon class I receptor is given in R73356. A recombinant soluble form of the extracellular domain of this receptor (R71723) has been used to raise immunomodulatory monoclonal antibodies.

Sequence 557 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Monoclonal antibodies produced against soluble forms of the human interferon alpha-beta receptor based on the full-length human IRN-sequence are claimed. The antibodies are useful for treatment and prophylaxis of disorders involving cell proliferation and/or viral

There is no transmembrane domain. The amino acid sequence is predicted from a cDNA clone (see also T73520) obtd. from human myeloma U366 cells. Soluble, non-membrane bound IFNAR splice-deleted forms 1 and 2 (see also W21806) probably regulate the response of human cells to IFNS, either by acting as IFN the response of human cells to IFNS, either by acting as IFN

Novel splice-deleted interferon alpha-receptor (IFNAR) form 2 (W21806) is characterised by a double deletion when compared to transmembranal IFNAR (W21804). The extracellular domain is shortened by 6 amino acid residues and is followed by a truncated intracellular domain. There is no transmembrane region. The amino acid sequence is predicted from a cDNA clone (see also T73521) obtd. from human myeloma U266 cells. Soluble, non-membrane bound IFNAR splice-deleted forms 1 (see also W21805) and 2 may regulate the response of human cells to IFNS, either by acting as IFN antagonists or by regulating IFN activities. They can be expressed in host cells and used to inhibit, modulate or modify the activities of IFNs alpha and beta in cells, tissues and organisms,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Inhibiting, modulating or modifying the activities of interferon(s Disclosure; Fig 7; 46pp; English.

Human transmembranal interferon alpha receptor (IFNAR) (W21804) includes a 21-amino acid transmembrane region. Novel, splice-deleted IFNAR forms 1 (W21805) and 2 (W21806) have been detected that lack this transmembrane domain. These, soluble non-membrane bound polypeptides can be expressed in host cells and used to inhibit, modulate or modify the activities of interferons alpha and beta in cells, tissues and organisms, or for diagnostic
Claim 2; Page -; 79pp; English.

This sequence is the human CRFB4 sequence, DNA encoding it is used recombinant DNA (1) of the invention. (1) comprises a sequence (Sl) encoding the interleukin-10 (IL-10) receptor (IL10R) and a sequence

C Cells containing (I) may be used to identify agonists/antagonist of C II-10. Agonists are potentially useful, e.g. for preventing allograft CC rejection, as vaccine adjuvants, for treatment of photosensitivity, confilammation, autoimmune disease and septic shock, while antagonists are potentially useful for increasing immune responses against tumours, viruses, bacteria and parasites (especially intracellular pathogens) and CC restore, e.g. by gene therapy, II-10 sensitivity to a cell that expresses a dysfunctional IIIOR and is able to bind II-10 but not to transduce a signal. Antisense CRFB4 sequences (especially ribozymes), can inhibit II-10 activity in cells. Antibodies specific for CRFB4 are used to measure and localise CRBF4, for diagnosts of defective II-10 activity. Fragments of (I) are used as primers or probes to assay CRFB4-specific CC RNA. Agonists/antagonists may be administered parenterally, orally or rectally especially by intravenous injection or directly into a tumour or callograft.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                 Novel human Zcytor7 DNA encodes a type 2 cytokine receptor - useful proven human Zcytor7 DNA encodes a type 2 cytokine receptor - useful for treating renal, neural, pancreatic and prostatic diseases Claim 1; Pages 55-59; 72pp; English.

Claim 1; Pages 55-59; 72pp; English.

This represents the Zcytor7 cytokine receptor. Zcytor7 is a ligand-cytokine receptor family (CRF2). An expression vector containing the Zcytor polynucleotide, operably linked to transcription promoter, a sequence polynucleotide, operably linked to transcription promoter, and a cencoding a transmembrane and intracellular domain, or both, and a croombinant production of the polypeptide. The sequences can be used to transcriptional terminator can be used to transform host cells for the recombinant production of the polypeptide. The sequences can be used to study the Zcytor7 gene and to isolate ligands binding to it. Zcytor7 is preferentially expressed in the kidney, pancreas, prostate or nervous tissue. Agonists of Zcytor7 can be used to stimulate proliferation and differentiation of cell in these organs. The antagonists and agonists can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

for interferon gamma, specifically induction of class I HLA
antigens, including use of AF-1 DNA in gene therapy
Disclosure; Fig 21A; 114pp; English.
The sequence is that of human interferon-gamma accessory factor-1.
Incorporation of AF-1 into immune and tumour cells re-establishes
normal function with elimination of malignant cells.
Sequence 337 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (UYNE-) UNIV NEW JERSEY.
